

Query-by-Example (QBE)

Iztok Sarnik, FAMNIT

Slides are based on

- *Raghu Ramakrishnan, Johannes Gehrke, Database Management Systems, McGraw-Hill, 3rd ed., 2007.*
- *Slides from „Cow Book“: R.Ramakrishnan, <http://pages.cs.wisc.edu/~dbbook/>*

QBE: Intro

- A “GUI” for expressing queries.
 - Based on the DRC!
 - Actually invented before GUIs.
 - Very convenient for simple queries.
 - Awkward for complex queries.
- QBE an IBM trademark.
 - But has influenced many projects
 - Especially PC Databases: Paradox, Access, etc.

'Example Tables' in QBE

- Users specify a query by filling in *example tables*, or *skeletons*; we will use these skeletons in our examples.

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>

<i>Boats</i>	<u>bid</u>	bname	color

<i>Sailors</i>	<u>sid</u>	sname	rating	age

Basics

- To print names and ages of all sailors:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
		P._N		P._A

- ❖ Print all fields for sailors with *rating* > 8, in ascending order by (*rating*, *age*):

<i>Sailors</i>	<u>sid</u>	sname	rating	age
P.			AO(1). >8	AO(2).

- ❖ QBE puts unique new variables in blank columns. Above query in DRC (no ordering):

IDB, QBE $\{\langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge T > 8\}$

Note: MiniQBE uses a slightly different syntax!

And/Or Queries

- Names of sailors younger than 30 *or* older than 20:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
		P.		< 30
		P.		> 20

- Names of sailors younger than 30 *and* older than 20:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	_Id	P.		< 30
	_Id	P.		> 20

- Names of sailors younger than 30 *and* rating > 4:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	_Id	P.	> 4	< 30

Duplicates

- *Single row with P*: Duplicates not eliminated by default; can force elimination by using UNQ.

<i>Sailors</i>	<u>sid</u>	sname	rating	age
UNQ.		P.		< 30

- ❖ *Multiple rows with P*: Duplicates eliminated by default!
Can avoid elimination by using ALL.

<i>Sailors</i>	<u>sid</u>	sname	rating	age
ALL.	_Id	P.		< 30
	_Id	P.		> 20

Join Queries

- Names of sailors who've reserved a boat for 8/24/96 and are older than 25 (note that dates and strings with blanks/special chars are quoted):

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	_Id	P._S		> 25

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>
	_Id		'8/24/96'

Note:
MiniQBE
uses double
quotes

- ❖ Joins accomplished by repeating variables.

Join Queries (Contd.)

- Names and ages of sailors who've reserved some boat that is also reserved by the sailor with *sid* = 22:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	_Id	P.		P.

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>
	22	_B	
	_Id	_B	

Unnamed Columns

MiniQBE allows
P. in multiple tables

- Useful if we want to print the result of an expression, or print fields from 2 or more relations.
 - QBE allows P. to appear in at most one table!

<i>Sailors</i>	<u>sid</u>	sname	rating	age		
	_Id	P.	_R	_A	P._D	P.(_R/_A)

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>
	_Id		_D

Join Queries (Contd.)

- Colors of boats named “Interlake” reserved by sailors who’ve reserved a boat for 8/24/96 and are older than 25 :

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	_Id	_S		> 25

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>
	_Id	_B	‘8/24/96’

<i>Boats</i>	<u>bid</u>	bname	color
	_B	‘Interlake’	P.

“Negative Tables”

- Can place a negation marker in the relation column:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	<u>_Id</u>	P._S		

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>
\neg	<u>_Id</u>	<u>_B</u>	

- ❖ Variables appearing in a negated table must also appear in a positive table!

Note:
MiniQBE
uses NOT
or ~.

Aggregates

- QBE supports **AVG, COUNT, MIN, MAX, SUM**
 - None of these eliminate duplicates, except COUNT
 - Also have **AVG.UNQ.** etc. to force duplicate elimination

<i>Sailors</i>	<u>sid</u>	sname	rating	age	
	_Id		G.P.AO	_A	P.AVG._A

- ❖ The columns with G. are the *group-by* fields; all tuples in a group have the same values in these fields.
 - The (optional) use of .AO orders the answers.
 - **Every column with P. must include G. or an aggregate operator.**

Conditions Box

- Used to express conditions involving 2 or more columns, e.g., $_R/_A > 0.2$.
- Can express a condition that involves a group, similar to the HAVING clause in SQL:

<i>Sailors</i>	<u>sid</u>	sname	rating	age	CONDITIONS
			P.G.	<u>_A</u>	AVG._A > 30

❖ Express conditions involving AND and OR:

<i>Sailors</i>	<u>sid</u>	sname	rating	age	CONDITIONS
		P.		<u>_A</u>	20 < _A AND _A < 30

Find sailors who've reserved all boats

- A division query; need aggregates (or update operations, as we will see later) to do this in QBE.

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	P.G._Id			

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>	CONDITIONS
	_Id	_B1		COUNT._B1= COUNT._B2

<i>Boats</i>	<u>bid</u>	bname	color
	_B2		

- ❖ How can we modify this query to print the names of sailors who've reserved all red boats?

Inserting Tuples

- Single-tuple insertion:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
I.	74	Janice	7	14

- ❖ Inserting multiple tuples (*rating* is *null* in tuples inserted below):

<i>Sailors</i>	<u>sid</u>	sname	rating	age
I.	_Id	_N		_A

<i>Students</i>	<u>sid</u>	name	login	age
	_Id	_N		_A

CONDITIONS
_A > 18 OR
_N LIKE 'C%'

Delete and Update

- Delete all reservations for sailors with *rating* < 4

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	_Id		< 4	

<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>
D.	_Id		

- ❖ Increment the age of the sailor with *sid* = 74

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	74			U._A+1

Restrictions on Update Commands

- Cannot mix I., D. and U. in a single example table, or combine them with P. or G.
- Cannot insert, update or modify tuples using values from fields of other tuples in the same table.
Example of an update that violates this rule:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
		john		_A
		joe		U._A+1

Should we update *every* Joe's age?
Which John's age should we use?

Find sailors who've reserved all boats (Again!)

- We want to find sailors $_Id$ such that there is no boat $_B$ that is not reserved by $_Id$:

<i>Sailors</i>	<u>sid</u>	sname	rating	age
	$_Id$	P. $_S$		

<i>Boats</i>	<u>bid</u>	bname	color	<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>
\neg	$_B$			\neg	$_Id$	$_B$	

- ❖ Illegal query! Variable $_B$ does not appear in a positive row. In what order should the two negative rows be considered? (Meaning changes!)

A Solution Using Views

- Find sailors who've not reserved some boat B:

<i>Sailors</i>	<u>sid</u>	sname	rating	age	<i>BadSids</i>	<u>sid</u>
	<u>_Id</u>	P._S			I.	<u>_Id</u>

<i>Boats</i>	<u>bid</u>	bname	color	<i>Reserves</i>	<u>sid</u>	<u>bid</u>	<u>day</u>
	<u>_B</u>			\neg	<u>_Id</u>	<u>_B</u>	

- Next, find sailors not in this 'bad' set:

<i>Sailors</i>	<u>sid</u>	sname	rating	age	<i>BadSids</i>	<u>sid</u>
	<u>_Id</u>	P._S			\neg	<u>_Id</u>

A Peek at MS Access

Microsoft Access - Sailors Query : Select Query

File Edit View Insert Query Tools Window Help

Sailors

- *
sid
sname
rating
age

Reserves

- *
sid
bid

Sort:				
Show:	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Criteria:		[Reserves].[sid]		"red"
or:				

Ready

Summary

- QBE is an elegant, user-friendly query language based on DRC.
- It is quite expressive (relationally complete, if the update features are taken into account).
- Simple queries are especially easy to write in QBE, and there is a minimum of syntax to learn.
- Has influenced the graphical query facilities offered in many products, including Borland's Paradox and Microsoft's Access.
