HELLO!

Nour

Basic definitions and notations

Let $V_1, ..., V_t$ be vector spaces over the field $\mathbb{F}_q$; $dim(V_i) = m_i$.

- The *t-order tensor product* $V := V_1 \otimes ... \otimes V_t$ is defined as the set of multilinear functions from $V_1^\vee \times ... \times V_t^\vee$ into $\mathbb{F}_q$, where $V_i^\vee$ is the dual space of V_i.
- *Fundamental (pure or rank-1) tensors* are tensors of the form $v_1 \otimes .... \otimes v_t$.
- The *rank* of a tensor $A \in V$ is the smallest integer r such that

$$A = \sum_{i=1}^{r} A_i \tag{1}$$

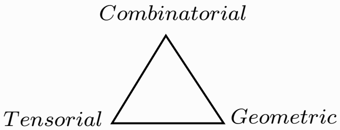
with each A_i a fundamental tensor of V.

$$V = V_1 \otimes \ldots \otimes V_t; \; V_i \cong \mathbb{F}_q^{n_i}$$

- Algorithms: given a tensor A, does there exist an algorithm that determines $R(A)$ and decompose it as the sum of fundamental tensors?
- Classifications: can we determine orbits of tensors under some natural group actions:
  - $G :=$ Stabiliser in $\mathrm{GL}(V)$ of the set of rank-1 tensors.

Our focus:

The classification of subspaces of $\mathrm{PG}(5, q)$.



Motivation

- $Rank(A) = Rank(\lambda A)$ for $A \in V$ and $\lambda \in \mathbb{F}$.
- Determining the rank of tensors in $V \iff$ Determining the rank of points in $\mathrm{PG}(V)$.
- Example: $\mathrm{PG}(\mathbb{F}_q^2 \otimes \mathbb{F}_q^3 \otimes \mathbb{F}_q^3) \cong \mathrm{PG}(17, \mathrm{q})$.

If $V = \mathbb{F}_q^2 \otimes \mathbb{F}_q^3 \otimes \mathbb{F}_q^3$, the number of G-orbits is **18** (ML, Sheekey, 2015).

G-orbits of subspaces of V:

- Classification of lines in $\mathrm{PG}(8, q)$ (ML, Sheekey, 2015).
- Classification of lines in $\mathrm{PG}(5, q)$ (ML, Popiel, 2020).
- Classification of Planes in $\mathrm{PG}(5, q)$, q odd, having at least one rank-1 point (ML, Popiel, Sheekey, 2020).

ALGEBRAIC VARIETIES:

- Fundamental tensors in $V \iff$ Points of the Segre variety.
- Example: $\sigma_{1,2,2} : \mathrm{PG}(\mathbb{F}_q^2) \times \mathrm{PG}(\mathbb{F}_q^3) \times \mathrm{PG}(\mathbb{F}_q^3) \longrightarrow \mathrm{PG}(17, q)$
$$(\ \langle v_1 \rangle, \langle v_2 \rangle, \langle v_3 \rangle\ ) \mapsto \langle v_1 \otimes v_2 \otimes v_3 \rangle.$$
- Fundamental tensors in the subspace of symmetric tensors in V $\iff$ Points of the Veronese variety.
- The Veronese surface: $\mathcal{V}(\mathbb{F}_q) \subset S_{2,2}(\mathbb{F}_q)$:
$$\nu : \mathrm{PG}(2, q) \longrightarrow \mathrm{PG}(5, q)$$
$$\langle (x_0, x_1, x_2) \rangle \mapsto (x_0^2, x_0x_1, x_0x_2, x_1^2, x_1x_2, x_2^2).$$
- K:= Stabiliser of $\mathcal{V}(\mathbb{F}_q)$.

Subspaces of $\mathrm{PG}(5, q)$ are points in $\mathrm{PG}(S^2\mathbb{F}_q^3 \otimes \mathbb{F}_q^r)$.

THE SPACE $\mathrm{PG}(5, q)$ AND LINEAR SYSTEMS OF CONICS

Linear systems of conics := **Subspaces**($\mathrm{PG}(W)$), where W = space of 2-forms on $\mathrm{PG}(2, q)$).

$$\nu : \mathrm{PG}(2, q) \longrightarrow \mathrm{PG}(5, q)$$
$$(x_0, x_1, x_2) \mapsto (x_0^2, x_0x_1, x_0x_2, x_1^2, x_1x_2, x_2^2),$$

- $C = \mathcal{Z}(a_{00}X_0^2 + a_{01}X_0X_1 + \ldots + a_{22}X_2^2)$ in $\mathrm{PG}(2, q)$ corresponds to the hyperplane section

$$H[a_{00}, a_{01}, a_{02}, a_{11}, a_{12}, a_{22}] \cap \mathcal{V}(\mathbb{F}_q).$$

Subspaces of $\mathrm{PG}(5, q)$ correspond to linear systems of conics in $\mathrm{PG}(2, q)$.

Particularly:

- a pencil of conics $\mathcal{P} = \langle C_1, C_2 \rangle$ corresponds to a solid of $\mathrm{PG}(5, q)$.
- a net of conics $\mathcal{N} = \langle C_1, C_2, C_3 \rangle$ corresponds to a plane of $\mathrm{PG}(5, q)$.
- a web of conics $\mathcal{W} = \langle C_1, C_2, C_3, C_4 \rangle$ corresponds to a line of $\mathrm{PG}(5, q)$.

Classifying linear systems of conics in $\mathrm{PG}(2, q) \iff$ classifying subspaces of $\mathrm{PG}(5, q)$.

Previous results on linear systems of conics

- Dickson (1908): Classified pencils of conics over $\mathbb{F}_q$, q odd.
- Wilson (1914): Incompletely classified rank-one nets of conics (nets with at least a $//$) over $\mathbb{F}_q$, q odd.
- Campbell (1927): Incompletely classified pencils of conics over $\mathbb{F}_q$, q even.
- Campbell (1928): Incompletely classified nets of conics over $\mathbb{F}_q$, q even.

PREVIOUS RESULTS ON ORBITS OF SUBSPACES OF $\mathrm{PG}(5,q)$:

- points, hyperplanes, for all q: ✓
- lines, for all q: ✓
  [ML, T. Popiel, 2020]
- solids, for q odd: ✓
  [ML, T. Popiel, 2020]
- planes meeting $\mathcal{V}(\mathbb{F}_q)$ non-trivially, for q odd: ✓

  [N. Alnajjarine, ML, T. Popiel, 2022]

- planes meeting $\mathcal{V}(\mathbb{F}_q)$ non-trivially, for q even.

$\mathrm{PG}(5, \mathit{odd})$ vs $\mathrm{PG}(5, \mathit{even})$

- **q odd:** $\exists$ a polarity: *the set of conic planes of* $\mathcal{V}(\mathbb{F}_q) \to$ *the set of tangent planes of* $\mathcal{V}(\mathbb{F}_q)$.
  - lines $\overset{\text{polarity}}{\Longleftrightarrow}$ solids.
  - $\mathcal{N} = \langle C_1, C_2, C_3 \rangle;\ C_1 = // \longrightarrow$
    $\pi = H_1 \cap H_2 \cap H_3 \xrightarrow{\text{polarity}}$
    $\pi' = \langle P_1, P_2, P_3 \rangle;\ P_1 \in \mathcal{V}(\mathbb{F}_q) \longrightarrow$
    Rank-one nets of conics $\Longleftrightarrow$ planes meeting $\mathcal{V}(\mathbb{F}_q)$ non-trivially.
- **q even:** No such polarity $\longrightarrow$
  - lines $\overset{?}{\Longleftrightarrow}$ solids.
  - Rank-one nets of conics $\overset{?}{\Longleftrightarrow}$ planes meeting $\mathcal{V}(\mathbb{F}_q)$ non-trivially.

OUR MAIN RESULT

- K:=Setwise stabiliser of $\mathcal{V}(\mathbb{F}_q)$ in $\mathrm{PGL}(6, q)$.
  - $q = 2$, $K \cong Sym(7)$ (as the kernel of this action is trivial).
  - $q > 2$, $K \cong \mathrm{PGL}(3, q)$.

Planes in $\mathrm{PG}(5, q)$ meeting $\mathcal{V}(\mathbb{F}_q)$, q even:

Theorem: *There are* 15 K*-orbits of planes having at least one rank-1 point in* $\mathrm{PG}(5, q)$ *and* 5 *when* $q = 2$.

Points and lines of $\mathrm{PG}(5, q)$

K**-orbits of Points**:

- Rank-one points $(q^2 + q + 1)$.
- Rank-two points in the *nucleus plane* $(q^2 + q + 1)$.
- Rank-two points outside the nucleus plane $(q^2 - 1)(q^2 + q + 1)$.
- Rank-three points $(q^5 - q^2)$.

- Each two points P,Q of $\mathcal{V}(\mathbb{F}_q)$ lie on a unique conic of defined by $\mathcal{C}_{P,Q} := \nu(\langle \nu^{-1}(P), \nu^{-1}(Q) \rangle)$.
- Each rank-2 point R of $\mathrm{PG}(5, q) = \langle \mathcal{V}(\mathbb{F}_q) \rangle$ defines a unique conic $\mathcal{C}_R$ in $\mathcal{V}(\mathbb{F}_q)$.

K**-orbits of lines**: *[ML-Popiel, 2020]* There are 15 K-orbits of lines in $\mathrm{PG}(5, q)$.

LINES IN $\mathrm{PG}(5, q)$, q EVEN:

Orbits	Point-OD's
o_5	$[2, 0, q-1, 0]$
o_6	$[1, 1, q-1, 0]$
$o_{8,1}$	$[1, 0, 1, q-1]$
$o_{8,2}$	$[1, 1, 0, q-1]$
o_9	$[1, 0, 0, q]$
o_{10}	$[0, 0, q+1, 0]$
$o_{12,1}$	$[0, q+1, 0, 0]$
$o_{12,2}$	$[0, 1, q, 0]$
$o_{13,1}$	$[0, 1, 1, q-1]$
$o_{13,2}$	$[0, 0, 2, q-1]$
o_{14}	$[0, 0, 3, q-2]$
o_{15}	$[0, 0, 1, q]$
$o_{16,1}$	$[0, 1, 0, q]$
$o_{16,2}$	$[0, 0, 1, q]$
o_{17}	$[0, 0, 0, q+1]$

REPRESENTATION OF SUBSPACES OF $\mathrm{PG}(5, q)$

- $\mathrm{PG}(5, q) = \langle \mathcal{V}(\mathbb{F}_q) \rangle$.
- Every point $x = (x_0, .., x_5) \in \mathrm{PG}(5, q)$ can be represented by

$$M_x = \begin{bmatrix} x_0 & x_1 & x_2 \\ x_1 & x_3 & x_4 \\ x_2 & x_4 & x_5 \end{bmatrix}$$

- The plane in $\mathrm{PG}(5, q)$ spanned by the 1st three points of the standard frame is

$$\pi = \begin{bmatrix} x & y & z \\ y & . & . \\ z & . & . \end{bmatrix} := \{ \begin{bmatrix} x & y & z \\ y & 0 & 0 \\ z & 0 & 0 \end{bmatrix} : (x, y, z) \in \mathbb{F}_q^3;\ (x, y, z) \in \mathrm{PG}(2, q) \}.$$

Planes of $\mathrm{PG}(5, q)$ and cubic curves in $\mathrm{PG}(2, q)$

$\pi \longrightarrow \mathrm{C} = \mathcal{Z}$(determinant of its matrix representation).

K-ORBITS INVARIANTS

Let W be a subspace of $\mathrm{PG}(5,q)$.

- The **rank distribution of** W is

$$[r_1, r_2, r_3]$$

where

$$r_i = \# \text{ of rank } i \text{ points in } W.$$

Let U_1, U_2,...,U_m denote the distinct K-orbits of r-spaces in $\mathrm{PG}(5,q)$.

- The r**-space orbit-distribution of** W is

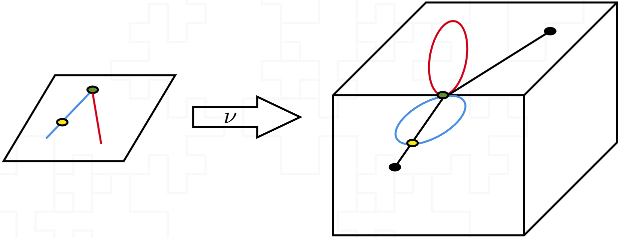
$$[u_1, u_2, \ldots, u_m],$$

where

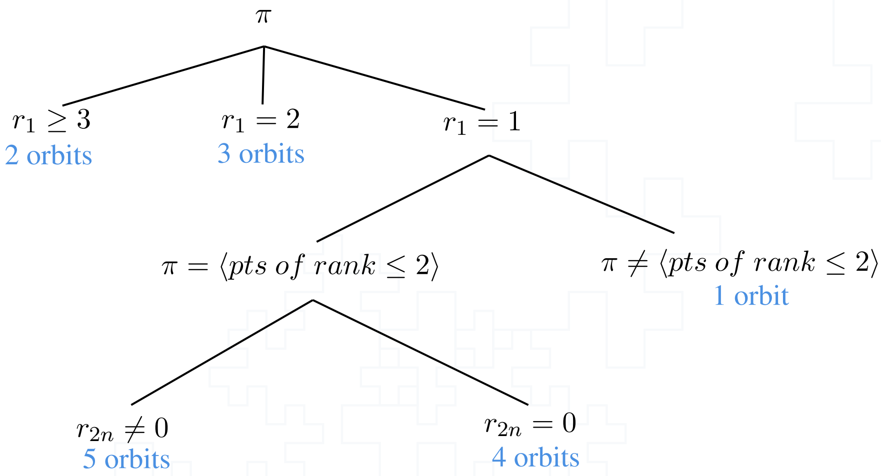
u_i = # of r-spaces incident with W which belong to the orbit U_i.

Properties and Approach:

- **Approach:** We study the possible Point-orbit distributions and discuss the possibility of planes with same Point-OD to split or not under the action of K.
- **Lemma:** Planes with rank distribution $[1, 0, q^2 + q]$ and $[2, r_2, r_3]$ with $r_2 < q$ do not exist.
- **Rank-2 points:** The geometry associated with rank-1,2 points can help! ($\pi = \langle Q_1, Q_2, ? \rangle$, where $rank(Q_1) = 1$ and $rank(Q_2) = 2$).



THE STRUCTURE OF DISCUSSION:



THE CASE $r_{2n} = 0$:

$\pi = \langle Q_1, Q_2, Q_3 \rangle$: $rank(Q_1) = 1$, $rank(Q_i) = 2$, $i = 2, 3$, and $\pi \cap \mathcal{N} = \emptyset$.

- $\mathcal{C}_{Q_2} = \mathcal{C}_{Q_3}$: $Q_1 \in \mathcal{C}_{Q_2}$ or $Q_1 \notin \mathcal{C}_{Q_2} \to \Sigma_6$.
- $Q_1 = U = \mathcal{C}_{Q_2} \cap \mathcal{C}_{Q_3}$.
- $Q_1 \in \mathcal{C}_{Q_2} \setminus \mathcal{C}_{Q_3}$.
- $Q_1 \notin \mathcal{C}_{Q_2} \cup \mathcal{C}_{Q_3}$:
  - The perspective is changed to study the possible line orbit of $\langle Q_2, Q_3 \rangle$.
  - $\langle Q_2, Q_3 \rangle \in o_{13,2} \iff Q_2 \in T_U(\mathcal{C}_{Q_2})$ and $Q_3 \notin T_U(\mathcal{C}_{Q_3})$, and $\langle Q_2, Q_3 \rangle \in o_{14} \iff Q_2 \notin T_U(\mathcal{C}_{Q_2})$ and $Q_3 \notin T_U(\mathcal{C}_{Q_3})$.
    - A line of type $o_{13,2}$ is contained in $\pi \to \Sigma_{12}, \Sigma_{13}, \Sigma_{14}$ $(q \neq 4)$ OR
    - No line of type $o_{13,2}$ is contained in $\pi \to \Sigma'_{14}$ $(q = 4)$.

K-orbits of planes	Representatives	Point-OD	Condition(s)
Σ_1	$\begin{bmatrix} x & y & . \\ y & z & . \\ . & . & . \end{bmatrix}$	$[q+1, 1, q^2-1, 0]$

Σ_{14}	$\begin{bmatrix} x & y & cx \\ y & y+z & . \\ cx & . & c^2x+z \end{bmatrix}$	$[1, 0, q\mp 1, q^2\pm 1]$	$Tr(c) = Tr(1), q \neq 4, (***)$
Σ'_{14}	$\begin{bmatrix} x+z & z & z \\ z & y+z & z \\ z & z & y \end{bmatrix}$	$[1, 0, q-1, q^2+1]$	$q = 4$
Σ_{15}	$\begin{bmatrix} x & y & z \\ y & z & . \\ z & . & . \end{bmatrix}$	$[1, 1, q-1, q^2]$	

THE ORBITS Σ_{12}, Σ_{13} AND Σ_{14}

- $\pi = \langle Rep\, of\; o_{13,2}, Q_1 \rangle; Q_1 = \nu(a,b,c) \to$

$$\pi_c = \begin{bmatrix} x & y & cx \\ y & y+z & . \\ cx & . & c^2x+z \end{bmatrix}$$

- The cubic curve associated with π_c is:

$$C_c = x(z^2 + yz + c^2y^2) + y^2z.$$

Inflexion Points of cubic curves

$$C = \sum_{0\leqslant i\leqslant j\leqslant k\leqslant 2} a_{ijk}X_iX_jX_k.$$

- $C = C(A, a)$; $a :=$ coefficient of $X_0X_1X_2$ and $A = [a_{ijk}]$.
- C' is the curve corresponding to the tangent lines to the curve C
- C'' is the curve corresponding to the tangent lines to the curve C'
- If $a \neq 0$, then inflexion points are nonsingular points of $C \cap C''$.

THE ORBITS Σ_{12}, Σ_{13} AND Σ_{14}

- $\pi = \langle Rep\, of\ o_{13,2}, Q_1 \rangle; Q_1 = \nu(a,b,c) \rightarrow$

$$\pi_c = \begin{bmatrix} x & y & cx \\ y & y+z & . \\ cx & . & c^2x+z \end{bmatrix}$$

- The cubic curve associated with π_c is:

$$C_c = x(z^2 + yz + c^2y^2) + y^2z.$$

- The Hessian of C_c is:

$$C_c'' = x(z^2 + yz + c^2y^2) + z^3 + (1+c^2)y^2z + c^2y^3.$$

- Let $y = 1$ and $\theta = c^{-1}z$: inflexion points of C_c correspond to solutions of $\theta^3 + \theta + c^{-1} = 0$.

Cubic equations over $\mathbb{F}_{2^h}$, (Berlekamp, Rumsey, Solomon, 1966)

$$\theta^3 + \theta + c^{-1} = 0,$$

- has three solutions if and only if $q \neq 4$, $Tr(c) = Tr(1)$ and c^{-1} is admissible: $c^{-1} = \frac{v+v^{-1}}{(1+v+v^{-1})^3}$ for some $v \in \mathbb{F}_q \setminus \mathbb{F}_4$,
- a unique solution if and only if $Tr(c) \neq Tr(1)$ and
- no solution if and only if $Tr(c) = Tr(1)$ and c^{-1} is not admissible

Characterization:

- Three inflexions $\rightarrow \Sigma_{14}$; $q \neq 4$.
- A unique inflexion point $\rightarrow \Sigma_{12}\ (q = 2^{even})$ *or* $\Sigma_{13}\ (q = 2^{odd})$.
- No inflexion points $\rightarrow \Sigma_{12}\ (q = 2^{odd})$ *or* $\Sigma_{13}\ (q = 2^{even})$.

THE UNIQUENESS OF Σ_{14}

Proof:

Let L (the inflexion line) be parametrised by $(0,1,0)$, $(0,0,1)$ and $(0,1,1)$ respectively and $Q_{a,b,c} = \nu(a,b,c)$. Then,

$$\pi_{a,b,c} = \langle L, Q_{a,b,c} \rangle \in \Sigma_{14}.$$

If follows that $\langle Q_{a,b,c}, E_i \rangle \in o_{8,1}$; $1 \leq i \leq 3$, and thus $a, b, c \neq 0$.

$$\pi_{b,c} : \begin{bmatrix} x+y & bx & cx \\ bx & b^2x+y+z & bcx \\ cx & bcx & c^2x+z \end{bmatrix}.$$

- $1+b+c=0, \rightarrow \#$.
- $1+b+c \neq 0$, $\mathscr{C}''_{b,c} = \mathcal{Z}(h_{b,c})$, $\alpha = (1+b^2+c^2)$ and $h_{b,c} = c^2\alpha^5 xy^2 + \alpha^5 xz^2 + c^2(1+b^2)\alpha y^3 + \alpha((1+b^2)+\alpha^3(b^2+c^2))yz^2 + \alpha(c^2(b^2+c^2)+\alpha^3(1+b^2))y^2 z + (b^2+c^2)\alpha z^3$.
  Imposing the conditions: $E_i \in \mathscr{C}''_{b,c}$; $1 \leq i \leq 3$, implies that $c^2(1+b^2)\alpha = (b^2+c^2)\alpha = c^2(1+b^2)\alpha + \alpha((1+b^2)+\alpha^3(b^2+c^2)) + \alpha(c^2(b^2+c^2)+\alpha^3(1+b^2)) + (b^2+c^2)\alpha = 0$.
  As $\alpha, c \neq 0$, we get $b = c = 1$.

Conclusion:

Φ_{14}: $\Sigma_{14} \longrightarrow o_{14} : \pi \mapsto L$ is a bijection.

Uniqueness of Σ_{12}, Σ_{13}

$q = 2^{even}$:

- $\pi \in \Sigma_{12}$ has a unique inflexion point $\xrightarrow{\mathbb{F}_{q^2}} \pi(\mathbb{F}_{q^2}) \in \Sigma_{14} \longrightarrow L(\mathbb{F}_{q^2}) \subset \mathrm{PG}(5, q^2)$ is the unique inflexion line in $\pi(\mathbb{F}_{q^2}) \longrightarrow L_s = L(\mathbb{F}_{q^2}) \cap \pi \in \{o_{15}, o_{16,2}\}$. Since $o_{16,2}$ cannot split by extension, $L_s \in o_{15}$.
- Φ_{12}: $\Sigma_{12} \longrightarrow o_{15} : \pi \mapsto L_s$ is a bijection ($o_{15} : [0, 0, 1, q]$).
- Similarly, we can extend our work to $\mathbb{F}_{q^3}$ to conclude Φ_{13}: $\Sigma_{13} \longrightarrow o_{17} : \pi \mapsto L_s$ is a bijection ($o_{17} : [0, 0, 0, q + 1]$).

Comparison with the q odd case:

Rank-one nets of conics $\not\Leftrightarrow$ planes meeting $\mathcal{V}(\mathbb{F}_q)$ non-trivially.

$\pi_6 \in \Sigma_6$ meets $\mathcal{V}(\mathbb{F}_q)$ in a unique point, however its associated net of conics $\mathcal{N}_6$ defined by

$$\alpha X_0 X_1 + \beta X_0 X_2 + \gamma(X_1^2 + cX_1X_2 + X_2^2) = 0$$

has $q+1$ pairs of real lines defined by the pencil

$$\mathcal{Z}(X_0X_1, X_0X_2) \; (\in \Omega_4),$$

and a unique pair of conjugate imaginary lines given by

$$\mathcal{Z}(X_1^2 + cX_1X_2 + X_2^2),$$

implying that $\mathcal{N}_6$ is not a rank-1 net of conics.
